

# INS6310A —1:10 Ultra-Low Additive Jitter Differential Clock Buffer

## FEATURES

- Two banks with 5 differential outputs each
  - LVPECL、LVDS、HCSL or Hi-Z (selectable per bank)
  - LVPECL additive jitter with clock source at 122.88MHz
    - 40 fs RMS (10KHz to 1MHz)
    - 80 fs RMS (12KHz to 20MHz)
- 3:1 Input Multiplexer
  - Two universal inputs operate up to 2.5GHz and accept LVPECL, LVDS, CML, SSTL, HSTL, HCSL or single-ended clocks
  - One crystal input accepts 10 to 40MHz crystal or single-ended clock
- High PSRR: -65/-76dBc (LVPECL/LVDS) at 156.25MHz
- LVC MOS output with synchronous enable input
- Pin-Controlled configuration
- $V_{DD}$  core supply:  $3.3V \pm 5\%$
- 3 independent  $V_{DDO}$  output supplies:  $3.3V/2.5V \pm 5\%$
- Industrial temperature range:  $-40^{\circ}C$  to  $+85^{\circ}C$
- Package: QFN48(7.0mm\*7.0mm\*0.75mm)
- 

## APPLICATIONS

- High speed Clock distribution and level translation
- Wireless BBU, RRU and Wired Communication
- Servers, Computing, PCI Express (PCIe)
- Switches, Routers, Line Cards, Timing Cards

## GENERAL DESCRIPTIONS

The INS6310A is a high performance, versatility 10-output differential fanout buffer intended for high-frequency, low-jitter clock/data distribution and level translation. The input clock can be selected from two universal inputs or one crystal input. The selected input clock is distributed to two banks of 5 differential outputs and one LVC MOS output. Both differential output banks can be independently configured as LVPECL, LVDS, or HCSL drivers, or disabled. The LVC MOS output has a synchronous enable input for runt-pulse-free operation when enabled or disabled. The INS6310A operates from a 3.3V core supply and 3 independent 3.3V/2.5V output supplies.

## 1 GENERAL DESCRIPTION

The INS6310A is a 2.5-GHz, 10-output differential fanout buffer intended for high-frequency, low-jitter clock/data distribution and level translation. The input clock can be selected from two universal inputs or one crystal input. The selected input clock is distributed to two banks of 5 differential outputs and one LVCMOS output. Both differential output banks can be independently configured as LVPECL, LVDS, or HCSL drivers, or disabled. The LVCMOS output has a synchronous enable input for runt-pulse-free operation when enabled or disabled. The INS6310A operates from a 3.3V core supply and 3 independent 3.3V/2.5V output supplies.

The INS6310A provides high performance, versatility, and power efficiency, making it ideal for replacing fixed-output buffer devices while increasing timing margin in the system.

The INS6310A does not have power supply sequencing requirements between the core and output supply domains.

Figure 1. Block Diagram

### 3 PINOUTS

Figure 2. Pinouts Diagram

Table 1. Pin Definition

PIN No.	PIN Name	TYPE	DESCRIPTIONS
1,2	QA0,nQA0	OUT	Bank A Differential clock output 0
3,4	QA1,nQA1	OUT	Bank A Differential clock output 1
5,8	V <sub>DDOA</sub>	PWR	Power supply for Bank A output buffers. V <sub>DDOA</sub> can operate from 3.3V or 2.5V. The V <sub>DDOA</sub> pins are internally tied together. Bypass with a 0.1uF low-ESR capacitor placed very close to each V <sub>DDO</sub> pin.
6,7	QA2,nQA2	OUT	Bank A Differential clock output 2
9,10	QA3,nQA3	OUT	Bank A Differential clock output 3
11,12	QA4,nQA4	OUT	Bank A Differential clock output 4
13, 18, 24, 37, 43, 48	GND	GND	Ground
14,47	OTYPEA[0] OTYPEA[1]	IN	Bank A Outputs selection pins. Pull down internally.
15,42	V <sub>DD</sub>	PWR	Power supply for core and input buffer blocks. The V <sub>DD</sub> supply operates from 3.3V. Bypass with a 0.1uF low-ESR capacitor placed very close to each V <sub>DD</sub> pin.

PIN No.	PIN Name	TYPE	DESCRIPTIONS
16	X <sub>IN</sub>	IN	Input for crystal. Can also be driven by a XO, TCXO, or other external single-ended clock.
17	X <sub>OUT</sub>	OUT	Output for crystal. Leave X <sub>OUT</sub> floating if X <sub>IN</sub> is driven by a single-ended clock.
19,22	SEL[0] SEL[1]	IN	Clock input selection pins. Pull down internally.
20,21	CLK0,nCLK0	IN	Universal clock input 0 (differential/single-ended).
23,39	OTYPEB[0] OTYPEB[1]	IN	Bank A Outputs selection pins. Pull down internally.
25,26	nQB4,QB4	OUT	Bank B Differential clock output 4
27,28	nQB3,QB3	OUT	Bank B Differential clock output 3
29,32	V <sub>DDOB</sub>	PWR	Power supply for Bank A output buffers. V <sub>DDOA</sub> can operate from 3.3V or 2.5V. The V <sub>DDOA</sub> pins are internally tied together. Bypass with a 0.1uF low-ESR capacitor placed very close to each V <sub>DDO</sub> pin.
30,31	nQB2,QB2	OUT	Bank B Differential clock output 2
33,34	nQB1,QB1	OUT	Bank B Differential clock output 1
35,36	nQB0,QB0	OUT	Bank B Differential clock output 0
38	NC	-	Not connected internally. Pin may be floated or grounded.
40,41	nCLK1,CLK1	IN	Universal clock input 1 (differential/single-ended).
44	REFOUT	OUT	LVC MOS reference output. Enable output by pulling REFOUT_OE pin high.
45	V <sub>DDOC</sub>	PWR	Power supply for Bank A output buffers. V <sub>DDOA</sub> can operate from 3.3V or 2.5V. The V <sub>DDOA</sub> pins are internally tied together. Bypass with a 0.1uF low-ESR capacitor placed very close to each V <sub>DDO</sub> pin.
46	REFOUT_OE	IN	REFOUT enable input. Enable signal is internally synchronized to select clock input. Pull down internally.
	EPAD		Connect to the PCB ground plane for heat dissipation.

## 4 ELECTRICAL CHARACTERISTICS

Table 2. Absolute Maximum Ratings

Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to the conditions as specified in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Value	Unit
------------	--------	-------	------

Power Supply Voltage	$V_{DD}$ $V_{DDOA}$ $V_{DDOB}$ $V_{DDOC}$	-0.3~3.6	V
Input Voltage	$V_{IN}$	-0.3~ $V_{DD}+0.3$	V
Storage Temperature Range	$T_{STG}$	-65~150	°C
Junction Temperature	$T_J$	150	°C
Thermal resistance from Junction to Ambient	$\theta_{JA}$	28.5	°C/W

Table 3. Recommended Parameters

Parameters	Symbol	Value			Unit	Notes
		Min.	Typ.	Max.		
Core Supply Voltage	$V_{DD}$	3.15	3.3	3.45	V	
Output Supply Voltage	$V_{DDOX}^{(1)}$	3.135	3.3	3.45	V	
		2.375	2.5	2.625		
Core Supply Current	$I_{VDD\_CORE}$		24	31	mA	All Outputs Disabled. Clock input 0 or 1 Selected.
			23	30	mA	All Outputs Disabled. Xin Selected.
	$I_{VDD\_LVDS}$		50	75	mA	Additive Core Supply Current, Per LVDS Bank Enabled
	$I_{VDD\_LVPECL}$		20	26	mA	Additive Core Supply Current, Per LVPECL Bank Enabled
	$I_{VDD\_HCSL}$		32	42	mA	Additive Core Supply Current, Per HCSL Bank Enabled
	$I_{VDD\_LVCMOS}$		4	5.2	mA	Additive Core Supply Current, Per LVCMOS Bank Enabled
Output Supply Current	$I_{VDDO\_LVDS}$		24	31	mA	Additive Out Supply Current, Per LVDS Bank Enabled
	$I_{VDDO\_LVPECL}$		230	299	mA	Additive Out Supply Current, Per LVPECL Bank Enabled
	$I_{VDDO\_HCSL}$		72	94	mA	Additive Out Supply Current, Per HCSL Bank Enabled
	$I_{VDDO\_LVCMOS}$		9	12	mA	Additive Out Supply Current, Per LVCMOS Bank Enabled
Ambient Temperature	$T_A$	-40		85	°C	

\* (1) DDOX will represent DDOA/DDOB/DDOC in general when no distinction is needed

Table 4. Control Signals input Characteristics

Test Condition:  $-40^{\circ}C \leq T_A \leq 85^{\circ}C, 3.15V \leq V_{DD} \leq 3.45V, 2.375V \leq V_{DDOX} \leq 2.625$  or  $3.135V \leq V_{DDOX} \leq 3.45$

Parameters	Symbol	Value			Unit	Notes

			-84		dBc	$F_{IN}=100\text{MHz}$
Input Frequency (CLK/nCLK)						
Input Frequency Range	$F_{IN}$	0		2500	MHz	Functional up to 2.5GHz, Output frequency range and timing specified per output type (refer to LVPECL, LVDS, HCSL, LVCMOS output)

Parameters	Symbol	Value			Unit	Notes
		Min.	Typ.	Max.		
specifications)						

\* (2) CLKx/nCLKx represent CLK0/nCLK0 和 CLK1/nCLK1

(3) For clock input frequency  $\geq 100\text{MHz}$ , CLKx can be driven with single-ended (LVCMOS) input swing up to 3.3VPP.

For clock input frequency  $< 100\text{MHz}$ , the single-ended input swing should be limited to 2VPP max to prevent input saturation (refer to Driving the Clock Inputs for interfacing 2.5V/3.3V LVCMOS clock input  $< 100\text{MHz}$  to CLKx).

(4) CLKx driven single-ended (AC or DC coupled), nCLKx AC coupled to GND or externally biased within VCM range

(5) AC coupled must be applied when VCM of input signals exceed VCMD Max..

Table 6. XIN/XOUT Characteristics

Test Condition:  $-40^{\circ}\text{C} \leq T_A \leq 85^{\circ}\text{C}$ ,  $3.15\text{V} \leq V_{DD} \leq 3.45\text{V}$ ,  $2.375\text{V} \leq V_{DDOX} \leq 2.625$  or  $3.135\text{V} \leq V_{DDOX} \leq 3.45$

Parameters	Symbol	Value			Unit	Notes
		Min.	Typ.	Max.		
Crystal Input						
Crystal Mode			Fundamental			
Crystal Frequency Input Range	fXIN/XOUT	10		40	MHz

## 5 FUNCTION DESCRIPTION

### 5.1 Control Signals

INS6310A has three groups of control signals:

- Input Selection
- Output Type Selection
- Reference Output Enable

Clock input selection is controlled using the SEL0 and SEL1 pins as shown in Table 11. Refer to Driving the Clock Inputs for clock input requirements. When CLK0 or CLK1 is selected, the crystal circuit is powered down. When Xin is selected, the crystal oscillator will start-up and its clock will be distributed to all outputs. Refer to Crystal Interface for more information. Alternatively, Xin may be driven by a single-ended clock, up to 250MHz, instead of a crystal.

Table 11. Input Selection

SEL[1]	SEL[0]	Selected Input
0	0	CLK0/nCLK0
0	1	CLK1/nCLK1
1	x	X <sub>IN</sub> /X <sub>OUT</sub>

The differential output buffer type for Bank A and Bank B outputs can be separately configured using the OTYPEA[1:0] and OTYPEB[1:0] inputs, respectively, as shown in table 12. For applications where all differential outputs are not needed, any unused output pin should be left floating with a minimum copper length to minimize capacitance and potential coupling and reduce power consumption. If an entire output bank will not be used, it is recommended to disable (Hi-Z) the bank to reduce power. Refer to Termination and Use of Clock Drivers for more information on output interface and termination techniques.

Table 12. Output Type Selection

OTYPEx[1]	OTYPEx[0]	Output Type (BankA or B)
0	0	LVPECL
0	1	LVDS
1	0	HCSL
1	1	Hi-Z

Notes: OTYPEx represent OTYPEA and OTYPEB

The reference output (REFOUT) provides a LVCMOS copy of the selected input clock. The LVCMOS output high level is referenced to the V<sub>DDO</sub> voltage. REFOUT can be enabled or disabled using the enable input pin, REFOUT\_OE, as shown in Table 13.

Table 13. Reference Output Enable

REFOUT_OE	Reference Output State
0	Hi-Z
1	Enabled

## 5.2 Input Clocks

**CLK/nCLK differential inputs:** The INS6310A has two differential inputs (CLK0/nCLK0 and CLK1/nCLK1) that can accept AC or DC coupled 3.3V/2.5V LVPECL, LVDS, CML, SSTL and other differential and single-ended signals that meet the input requirements specified in ELECTRICAL CHARACTERISTICS. The device can accept a wide range of signals due to its wide input common mode voltage range ( $V_{CM}$ ) and input voltage swing ( $V_{ID}$ ). It is recommended that the inputs have a high slew rate of 3 V/ns (differential) or higher in case to degrade the noise floor and jitter. For this reason, a differential input signal is recommended over single-ended because it typically provides higher slew rate and common-mode noise rejection.

**CLK/nCLK single-ended inputs:** It is possible to drive it with a single-ended clock. For large single-ended input signals, such as 3.3V or 2.5V LVCMOS, a 50Ω load resistor should be placed near the input for signal attenuation to prevent input overdrive as well as for line termination to minimize reflections. The CLK input has an internal bias voltage of about 1.4V, so the input can be AC coupled as shown in Figure3. The output impedance of the LVCMOS driver plus R1 should be close to 50 Ω to match the characteristic impedance of the transmission line and load termination.

Figure 3. Single-Ended LVCMOS input, AC Coupling

A single-ended clock may also be DC coupled to CLKx as shown in Figure 4. A 50Ω load resistor should be placed near the CLKx input for signal attenuation and line termination. Because half of the single-ended swing of the driver ( $V_{O,PP}/2$ ) drives CLKx, nCLKx should be externally biased to the midpoint voltage of the attenuated input swing ( $(V_{O,PP}/2) \times 0.5$ ). The external bias voltage should be within the specified input common voltage ( $V_{CM}$ ) range. This can be achieved using external biasing resistors in the kΩ range (R3 and R4) or another low-noise voltage reference. This will ensure the input swing crosses the threshold voltage at a point where the input slew rate is the highest.

Figure 4. Single-Ended LVCMOS input, DC Coupling

**X<sub>IN</sub>/X<sub>OUT</sub>:** If the crystal oscillator circuit is not used, it is possible to drive the X<sub>in</sub> input with a single-ended external clock as shown in Figure 5. The input clock should be AC coupled to the X<sub>in</sub> pin, which has an internally generated input bias voltage, and the X<sub>out</sub> pin should be left floating. While X<sub>in</sub> provides an alternative input to multiplex an external clock, it is recommended to use either differential input (CLK<sub>x</sub>) since it offers higher operating frequency, better common mode, improved power supply noise rejection and greater performance over supply voltage and temperature variations.

Figure 5. X<sub>IN</sub> Single-Ended LVCMOS Clock

The INS6310A has an integrated crystal oscillator circuit that supports a fundamental mode, AT-cut crystal. The crystal interface is shown in Figure 6, while C<sub>L</sub> is specified for the crystal and C<sub>Shunt</sub> is the sum of C<sub>IN</sub> and PCB C<sub>STRAY</sub>.

As shown in Figure 6, an external resistor, R<sub>LIMIT</sub>, can be used to limit the crystal drive level if necessary. If the power dissipated in the selected crystal is higher than the drive level specified for the crystal with R<sub>LIMIT</sub> shorted, then a larger resistor value is mandatory to avoid overdriving the crystal. However, if the power dissipated in the crystal is less than the drive level with R<sub>LIMIT</sub> shorted, then a zero value for R<sub>LIMIT</sub> can be used. As a starting point, a suggested value for RLIM is 1.5kΩ.

Figure 6. X<sub>IN</sub>/X<sub>OUT</sub> Crystal Interface

### 5.3 CLOCK OUTPUTS

INS6310A has two banks of 5 differential outputs and one LVCMOS output which can be independently supplied with 3.3V or 2.5V.

Table 14. Clock Outputs

Bank	Outputs
Bank A	QA0, QA1, QA2, QA3, QA4
Bank B	QB0, QB1, QB2, QB3, QB4
REFOUT	REFOUT

Table 2 following will be the state of the outputs.

Table 15. Input Vs. Output States

SEL[1]	Input Clock	Output State
Logic Low	CLKx=Open nCLKx=Open	Logic Low
	CLK= Logic High nCLK= Logic Low	Logic High
	CLK= Logic Low nCLK= Logic High	Logic Low
	CLK and nCLK short	Logic Low
Logic High	X <sub>IN</sub> = Logic High	Logic Low
	X <sub>IN</sub> = Logic Low	Logic High

### Notes

- Unused outputs should be left floating with a minimum copper length to minimize capacitance. In this way, this output will consume minimal output current because it has no load.

### 5.3.1 Termination and Use of Clock Drivers

When terminating clock drivers keep in mind these guidelines for optimum phase noise and jitter performance:

- Transmission line theory should be followed for good impedance matching to prevent reflections.
- Clock drivers should be presented with the proper loads.
  - LVDS outputs are current drivers and require a closed current loop.
  - HCSL drivers are switched current outputs and require a DC path to ground via 50Ω termination.
  - LVPECL outputs are open emitter and require a DC path to ground.
- Receivers should be presented with a signal biased to their specified DC bias level (common mode voltage) for proper operation. Some receivers have self-biasing inputs that automatically bias to the proper voltage level; in this case, the signal should normally be AC coupled.

It is possible to drive a non-LVPECL or non-LVDS receiver with a LVDS or LVPECL driver as long as the above guidelines are followed. Check the datasheet of the receiver or input being driven to determine the best termination and coupling method to be sure the receiver is biased at the optimum DC voltage (common mode voltage)

#### Termination for LVDS Driver

For DC coupled operation, terminate with 100Ω as close as possible to the LVDS receiver. For AC coupled operation by adding DC blocking capacitors, the load termination resistor and AC coupling capacitors should be placed as close as possible to the receiver inputs to minimize stub length, as shown in Figure 7

Figure 7. LVDS DC&AC Coupling

**Termination for LVPECL Driver**

For DC coupled operation of an LVPECL driver, terminate with  $50\ \Omega$  to  $V_{DDO} - 2V$ . Alternatively terminate with a Thevenin equivalent circuit for  $V_{DDO}$  (output driver supply voltage) = 3.3V and 2.5V. In the Thevenin equivalent circuit, the resistor dividers set the output termination voltage ( $V_{TT}$ ) to  $V_{DDO} - 2V$ . as shown in Figure 8

Figure 8. LVPECL DC Coupling

When AC coupling an LVPECL signal use  $160\ \Omega$  emitter resistors (or  $91\ \Omega$  for  $V_{DDO} = 2.5V$ ) close to the LVPECL driver to provide a DC path to ground as shown in Figure 9. For proper receiver operation, the signal should be biased to the DC bias level (common mode voltage) specified by the receiver. The typical DC bias voltage (common mode voltage) for LVPECL receivers is 2.0V. Alternatively, a Thevenin equivalent circuit forms a valid termination as shown in Figure 9 for  $V_{DDO} = 3.3V$  and 2.5V. This Thevenin circuit is different from the DC coupled example in Figure 8, since the voltage divider is setting the receiver input common mode voltage.

Figure 9. LVPECL AC coupling, Thevenin equivalent

**Termination for HSCL Driver**

For DC coupled operation of an HCSL driver, terminate with 50Ω to ground near the driver output as shown in Figure 10. Series resistors,  $R_s$ , may be used to limit overshoot due to the fast transient current. Because HCSL drivers require a DC path to ground, AC coupling is not allowed between the output drivers and the 50Ω termination resistors.

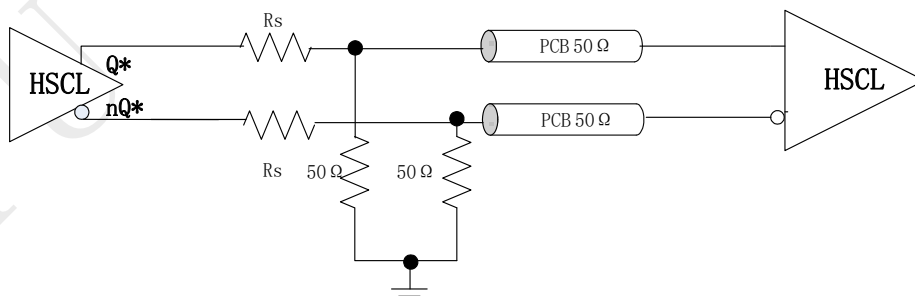

Figure 10. HCSL Operation, DC Coupling

## 5.4 Power Supply

The INS6310A operates from a 3.3V core supply and 3 independent 3.3V/2.5V output supplies.

VDD is INS6310A core supply voltage support 3.3V.

VDDOA, VDDOB and VDDOC are power supply for Bank A, B, C output buffers respectively. They can operate from 3.3V or 2.5V.

---

### Notes

- $V_{DDO}$  should be less than or equal to  $V_{DD}$  ( $V_{DDO} \leq V_{DD}$ )
  - .1uF or 0.01uF bypass capacitors should be placed very close to each supply pin
  - 1uF to 10uF Decoupling capacitors should be placed nearby
-

## 6 ENVIRONMENT

Table 16. ENVIRONMENT CONDITIONS

Parameters	Value	Unit	Notes
ESD Level	±2000V	V	HBM, Refer to ANSI/ESDA/JEDEC JS-001-2010
	±800V	V	CDM, Refer to JEDEC specification JESD22-C101
