### Overview

INS5A8900 is a high-accuracy I<sup>2</sup>C bus interface real-time clock with low power consumption. It embeds a 32.768KHz TCXO. The high precise temperature sensor and temperature compensated circuit ensure the high clock accuracy. It supports calendar (year, month, day, hour, minute, second), clock and timer functions etc. The SMD3225 package with only 0.9mm thickness and AEC-Q100 compliant makes it suitable for automotive applications.

Note:

1, After power-up reset or in case VLF bit returns “1”, make sure to initialize all registers to default state before using the RTC. Ensure all inputs are in the required range and the defined values are set for the reserved bits in case the clock cannot work normally.

- ✓ During the initial power-up, below bits will be in the state as below:  
 Initial 0: TEST, WADA, USEL, TE, FSEL[1:0], TSEL[0], UF, TF, AF, CSEL[1], UIE, TIE, RESET, VDETOFF, SWOFF, BKSMP[1:0], VBATSW.  
 Initial 1: VLF, VDET, CSEL[0].
- ✓ All other register values are undefined, so make sure to reset the module before using it.
- ✓ The bits marked with “○” can be read out “0” only after initializing.
- ✓ The bits marked with “●” are RAM bits which can be used to write or read any data.
- ✓ Only 0 can be written to UF, TF, AF, VLF, VDET bits.
- ✓ Make sure “0” to be written for TEST bits which are used for testing only.
- ✓ Reserved bits must be set to the defined values accordingly.

Table13. V<sub>DD</sub> Voltage Sampling Time

VDD Detect Function	VDETOFF	SWOFF	BKSMP [1]	BKSMP [0]	V <sub>DD</sub> Voltage Sampling Time	Switch ON/OFF	K1	Notes
ON	0	X	0	0	2ms	2ms OFF		Default

			1	1	256ms	256ms OFF		
OFF	1	0	x	x	OFF	ON		SW1 Close
		1	x	x	OFF	OFF		SW1 Open

The power circuit diagram is shown below:

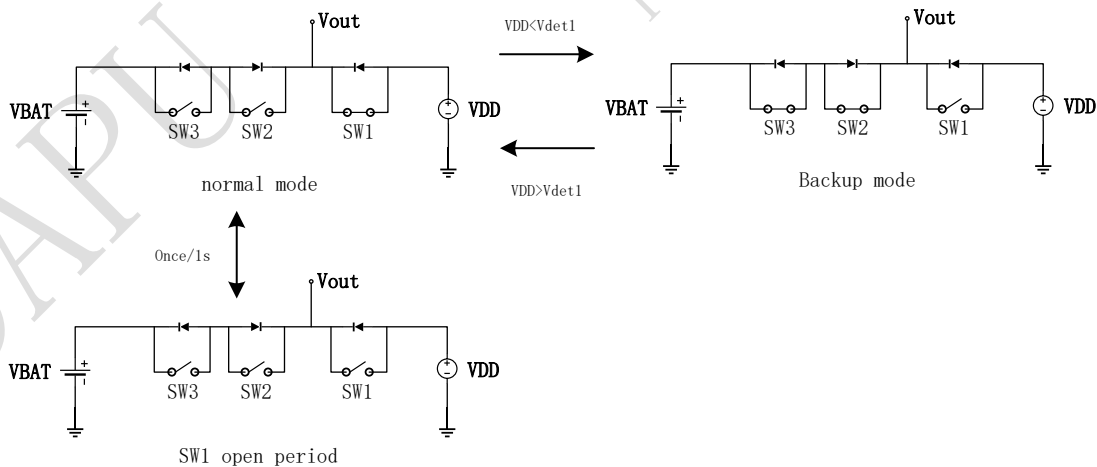

When chip power on, SW1 and SW2 are open, SW3 is close. Chip power supply is from VBAT or VDD through a diode.

a. Non-re-chargeable control (INIEN=1, CHGEN=0):

When VDD is greater than VDET1, chip work on normal mode. Vdet1 detection always work, and SW1 will open once/1s.

When VDD is smaller than VDET1, chip work on backup mode. Vdet1 detection work once per 31.25ms.

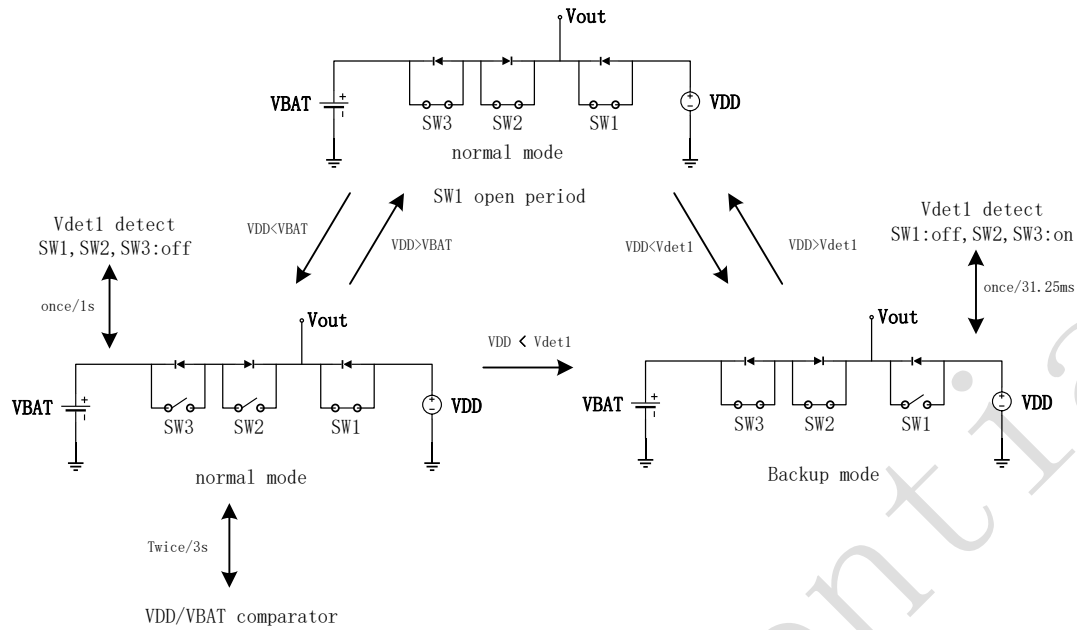

b. Re-chargeable control (INIEN=1, CHGEN=1):

Charge mode is valid when VDD is greater than VBAT, and VDD is greater than VDET1. In this mode, SW1/SW2/SW3 are close. The VDD charges VBAT. Vdet1 detection always work. SW1 open once/s.

When VDD < VBAT, chip will enter normal mode. Vdet1 detection always work. SW1 open once/s.

When  $VDD < VDET1$ , chip will enter backup mode. Vdet1 detection work once per 31.25ms.

## 4 I<sup>2</sup>C Bus Interface

I<sup>2</sup>C bus supports bi-directional communications through a serial clock line SCL and a serial data line SDA. I<sup>2</sup>C bus device can be defined as “Master” and “Slave”. INS5A8900 can only be used as Slave.

### 4.1 Cautions

I<sup>2</sup>C bus includes START, RESTART, STOP conditions, the duration between START and STOP must be less than 1 second just in case the bus to be set to standby mode automatically. A new START condition must be transferred before restarting of any communications.

INS5A8900 I<sup>2</sup>C bus interface supports single byte read/write operations as well as multiple bytes incremental access. After 0xFF address, the next one will be 0x00.

### 4.2 Slave Address

**Table14. I<sup>2</sup>C Bus Slave Address**

Transfer data	Slave address							R/W
	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
65h (Read)	0	1	1	0	0	1	0	1 (Read)
64h (Write)								0 (Write)

INS5A8900 I<sup>2</sup>C bus Slave Address is [0110 010\*].

### 4.3 I<sup>2</sup>C bus protocol

It is assumed CPU is master and INS5A8900 is slave in this section.

#### 4.3.1 Write process

I<sup>2</sup>C bus includes an address auto-increment function, once the initial address has been specified, the INS5A8900 increments (+1) the address automatically after each data is sent, then to write next data.

- (1) CPU sends start condition[S]
- (2) CPU sends INS5A8900's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from INS5A8900
- (4) CPU sends write address to INS5A8900
- (5) CPU verifies ACK signal from INS5A8900
- (6) CPU sends write data to the address specified at step (4)
- (7) CPU verifies ACK signal from INS5A8900
- (8) Repeat (6) (7) if multiple bytes need to be written, address will be incremented automatically
- (9) CPU ends stop condition[P]

### 4.3.2 Read process

Writing the address to be read with write mode firstly, then reading the data with read mode.

- (1) CPU sends start condition[S]
- (2) CPU sends INS5A8900's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from INS5A8900
- (4) CPU sends address for reading from INS5A8900
- (5) CPU verifies ACK signal from INS5A8900
- (6) CPU sends RESTART condition [Sr]
- (7) CPU sends INS5A8900's slave address with R/W bit to set to read mode
- (8) CPU verifies ACK signal from INS5A8900
- (9) CPU reads data from the specified address in step (4)
- (10) CPU sends ACK signal for "0"
- (11) Repeat (9) (10) if multiple bytes need to be read, address will be incremented automatically
- (12) CPU sends ACK signal for "1"
- (13) CPU sends stop condition[P]

Note: It is suggested to solder IC under the condition shown in the curve above. Must pay attention to the temperature and time when manual soldering, if the temperature over +260°C, or you will make the xo performance bad, even damage it.
