Note:

1, After power-up reset or in case VLF bit returns "1", make sure to initialize all registers to default state before using the RTC. Ensure all inputs are in the required range and the defined values are set for the reserved bits in case the clock cannot work normally.

- ✓ During the initial power-up, below bits will be in the state as below:
  - Initial 0: TEST, CSEL[1], RESET.
  - Initial 1: VLF, CSEL[0].
- ✓ All other register values are undefined, so make sure to reset the module before using it.
- ✓ The bits marked with "○" can be read out "0" only after initializing.
- ✓ The bits marked with "●" are RAM bits which can be used to write or read any data.
- ✓ Only 0 can be written to VLF bits.
- ✓ Make sure "0" to be written for TEST bits which are used for testing only.
- ✓ Reserved bits must be set to the defined values accordingly.

## 7 I<sup>2</sup>C Bus Interface

I<sup>2</sup>C bus supports bi-directional communications through a serial clock line SCL and a serial data line SDA. I<sup>2</sup>C bus device can be defined as “Master” and “Slave”. INS5710A can only be used as Slave.

### 7.1 Cautions

I<sup>2</sup>C bus includes START, RESTART, STOP conditions, the duration between START and STOP must be less than 1 second just in case the bus to be set to standby mode automatically. A new START condition must be transferred before restarting of any communications.

INS5710A I<sup>2</sup>C bus interface supports single byte read/write operations as well as multiple bytes incremental access. After 0x7F address, the next one will be 0x00.

### 7.2 Slave Address

Table12. I<sup>2</sup>C Bus Slave Address

Transfer data	Slave address							R/W
	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
65h (Read)	0	1	1	0	0	1	0	1 (Read)
64h (Write)								0 (Write)

INS5710A I<sup>2</sup>C bus Slave Address is [0110 010\*].

### 7.3 I<sup>2</sup>C bus protocol

It is assumed CPU is master and INS5710A is slave in this section.

#### 7.3.1 Write process

I<sup>2</sup>C bus includes an address auto-increment function, once the initial address has been specified, the

INS5710A increments (+1) the address automatically after each data is sent, then to write next data.

- (1) CPU sends start condition[S]
- (2) CPU sends INS5710A's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from INS5710A
- (4) CPU sends write address to INS5710A
- (5) CPU verifies ACK signal from INS5710A
- (6) CPU sends write data to the address specified at step (4)
- (7) CPU verifies ACK signal from INS5710A
- (8) Repeat (6) (7) if multiple bytes need to be written, address will be incremented automatically
- (9) CPU ends stop condition[P]

### 7.3.2 Read process

Writing the address to be read with write mode firstly, then reading the data with read mode.

- (1) CPU sends start condition[S]
- (2) CPU sends INS5710A's slave address with R/W bit to set to write mode
- (3) CPU verifies ACK signal from INS5710A
- (4) CPU sends address for reading from INS5710A
- (5) CPU verifies ACK signal from INS5710A
- (6) CPU sends RESTART condition [Sr]
- (7) CPU sends INS5710A's slave address with R/W bit to set to read mode
- (8) CPU verifies ACK signal from INS5710A
- (9) CPU reads data from the specified address in step (4)
- (10) CPU verifies ACK signal from INS5710A
- (11) Repeat (9) (10) if multiple bytes need to be read, address will be incremented automatically
- (12) CPU sends ACK signal for "1"
- (13) CPU sends stop condition[P]
