5. UART

UART interfaces are used for management and TOD, which has a fixed baud rate (115200) using 1 stop bit and no parity. It is a LVTTTL-compatible port and needs an external translator to work with other signal types (such as RS-232C or RS-485).

Time of Day

A TOD message format can be a GPRMC message or one of a group of other GPS messages or proprietary messages to suit specific causes. Such as a GPRMC message has the format \$GPRMC,122356,A,0000.0000,N,00000.0000,W,0.0.0.0,120508,,A*F6 in which the commas are separators. The message is 62 characters in length (i.e. 62 bytes). No parity bit is used, but each byte has a stop bit. The architecture of the message is shown in Table 4.

Table 4 Architecture of GPRMC message

| Elements | Description |
|--------------|---|
| \$GPRMC | Message header. |
| 122356 | UTC value. |
| A | Status (A = active, V = void). |
| 0000.0000,N | Latitude, north (fixed to zero). |
| 00000.0000,W | Longitude, west (fixed to zero). |
| 0.0 | Speed over ground (fixed to zero). |
| 0.0 | Track angle (fixed to zero). |
| 120508 | Date (ddmmyy). |
| A | A = autonomous, D = differential, E = estimated, S = simulation, N = not valid. |
| *F6 | Checksum. |

6. Control and Status Pins

CM30 is a clock module which synchronizes the local clock to reference such as 1 PPS retrieving from GPS. CM30 will work normally performing synchronizing algorithm when the SYNC_CTRL pin is driven high. It also could be force to work in free-run or holdover status when the SYNC_CTRL pin is driven low.

The LOCK pin indicates the lock status of CM30. High level indicates the module is locked to external 1PPS reference. When the module never is locked to reference after power up, the status of module is free-run, the LOCK pin outputs low. When the reference is lost, the status of module is holdover, the LOCK pin also output low.
